at  
U.S. – China Clean Energy Workshop  
Birmingham, Alabama, USA  
18 April 2013

# Introduction

---

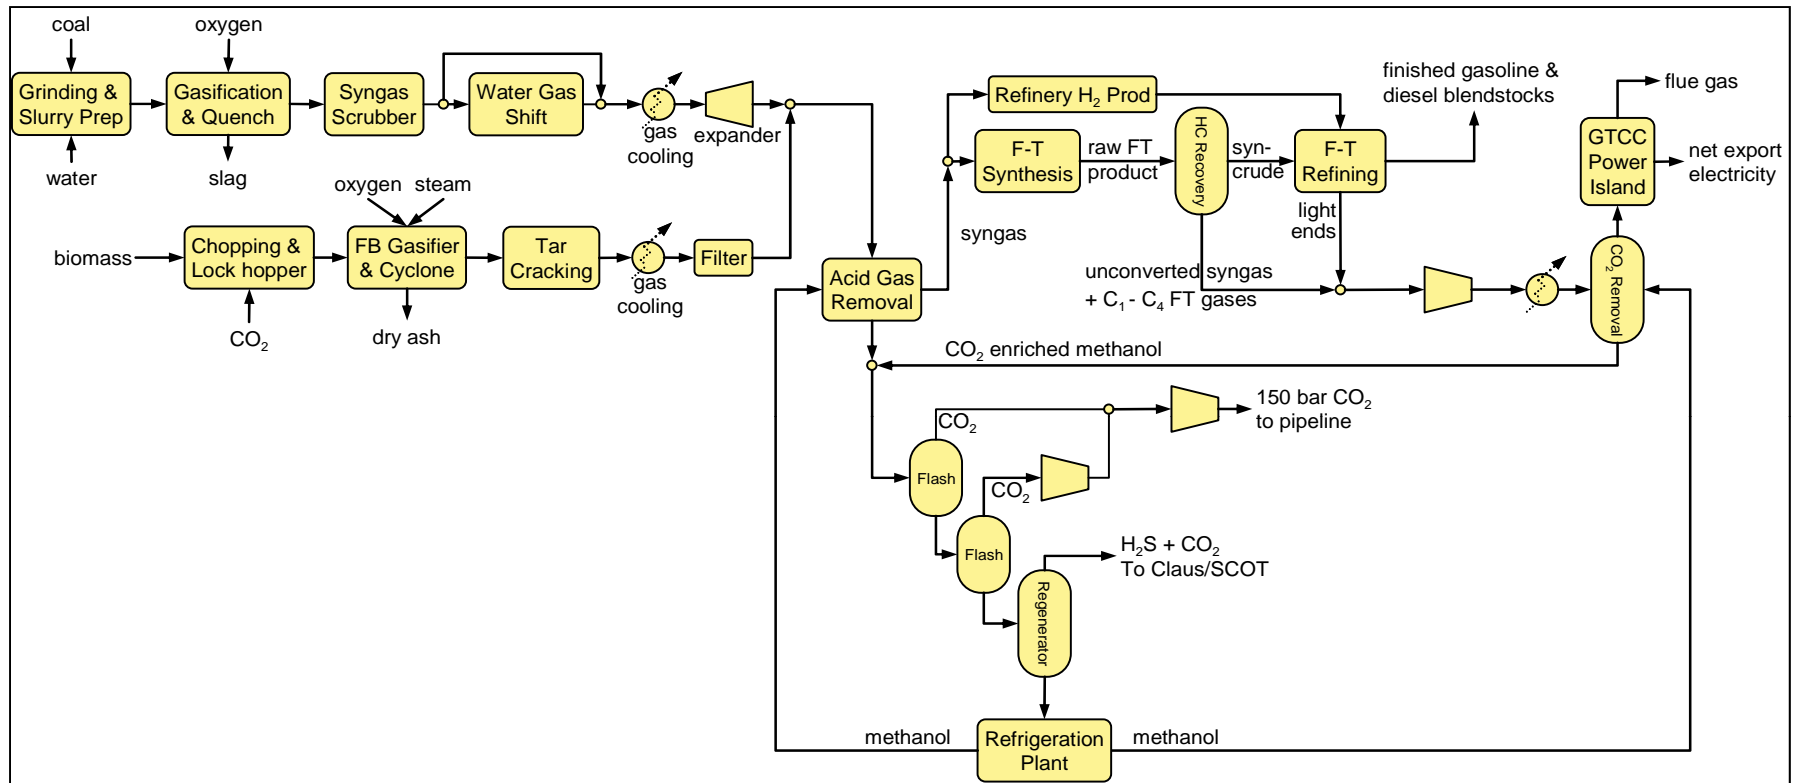

- In just-published *Cornerstone* article (Williams, 2013), I argue that coal/biomass coprocessing to make liquid transportation fuels (FTL) + electricity with CCS is key to profitably providing liquid transportation fuels and electricity under a stringent C-mitigation policy.
- In its recent report to Energy Secretary Chu (NCC, 2012), the National Coal Council recommended that the coal industry and Energy Secretary work together to find ways whereby:
  - Early-mover coal-based CO<sub>2</sub> capture projects linked to CO<sub>2</sub> enhanced oil recovery (EOR) opportunities could be financed and built to enable cost reduction via experience [learning by doing (LBD)]
  - A coal/biomass coproduction plant with captured CO<sub>2</sub> used for EOR be financed, built, and demonstrated at commercial scale
- This presentation suggests how both of these NCC report recommendations might be implemented

# F-T Liquid Transportation Fuels + Electricity via CTL-OT-CCS

This gasification-based system (Liu et al., 2011) makes from coal Fischer-Tropsch liquid (CTL) transportation fuels in a “once-through” (OT) system configuration that provides electricity as a major coproduct. It is assumed that CO<sub>2</sub> is captured both upstream and downstream of synthesis for sale into the CO<sub>2</sub> EOR market.

# F-T Liquid Transportation Fuels + Electricity via CBTL-OT-CCS

This system (Liu et al., 2011) is like CTL-OT-CCS except that biomass is coprocessed with coal in the manufacture of F-T transportation fuels and electricity.

# Proposed CO<sub>2</sub> Capture Technology Cost Buydown Policy That Is Affordable by a Fiscally Constrained Government

---

- Policy proposal: The federal government invest in technology cost buy-down (via LBD) for CO<sub>2</sub> capture technologies linked to EOR opportunities.
- A side benefit to the government would be to generate new federal revenue streams (corporate income taxes/royalties) from new domestic liquid fuels production.
- As will be shown, the coproduction of FTL and electricity via coal/biomass coprocessing is a strong candidate for this approach to technology cost buydown...the first step of which is to provide the financing needed for a first-of-a-kind (FOAK) commercial-scale demonstration project of this technology .

# Buying Down Technology Cost for Early Mover Projects Selling Captured CO<sub>2</sub> for EOR

---

- FOAK costs are estimated via “back-casting” from cost estimates for N<sup>th</sup>-of-a-kind (NOAK) plants.
- Assumptions:
  - FOAK costs = 2.0 X NOAK costs (consistent w/Edwardsport IGCC experience);
  - Learning rate for capital and O&M costs = historical rate for SO<sub>2</sub> scrubbers (Rubin et al., 2004)—11% for each cumulative doubling of output;
  - All plants sell captured CO<sub>2</sub> for EOR;
  - CO<sub>2</sub> purchase price (\$/t) at EOR site = 0.444 x (crude oil price, \$/bbl) [average for Permian Basin, 2008-2010—see Wehner (2011)].
  - Crude oil price = \$90/bbl and CO<sub>2</sub> transport cost = \$10/t;
  - **Subsidy must be sufficient to reduce levelized cost of electricity (LCOE) to LCOE for a natural gas combined cycle power plant venting CO<sub>2</sub>;**
  - Subsidies offered as competitively-bid grants (proportional to capture rates);
  - Subsidies financed to extent feasible from new federal revenue streams from new domestic liquid fuel production; shortfall is provided by general federal funds (GFF).

# Options for Technology Cost Buy-Down in CO<sub>2</sub> EOR Applications

<sup>a</sup> GHGI, the greenhouse gas emissions index is defined as the ratio of the “cradle-to-grave” GHG emissions for the system to the emissions for the conventional fossil energy displaced. The latter are assumed to be electricity from new supercritical coal plants venting CO<sub>2</sub> (Sup PC-V) and the equivalent crude oil-derived products.

| Capital (TPC+OC), NOAK plant, \$10 <sup>6</sup>                                     | 713          | 1809         | 2098           | 839                | 2040           | 2050                |

<sup>a</sup> All options satisfy EPA's proposed New Source Performance Standard for new power plant CO<sub>2</sub> emissions [(1000 lb/MWh<sub>e</sub> (gross))] by wide margins.

## Screening Analysis: IRRE vs Crude Oil Price for NOAK Plants

- Systems sell CO<sub>2</sub> into EOR markets
- Assumed prices:
  - Plant-gate CO<sub>2</sub> price (\$/t) = 0.444\*(crude oil price, \$/bbl)
  - CO<sub>2</sub> transport cost = \$10/t (nearby CO<sub>2</sub> EOR opportunity)
  - Coal, biomass, NG prices: \$2.5/GJ; \$5.0GJ, \$5.4/GJ
  - GHG emissions: \$0/t CO<sub>2e</sub>

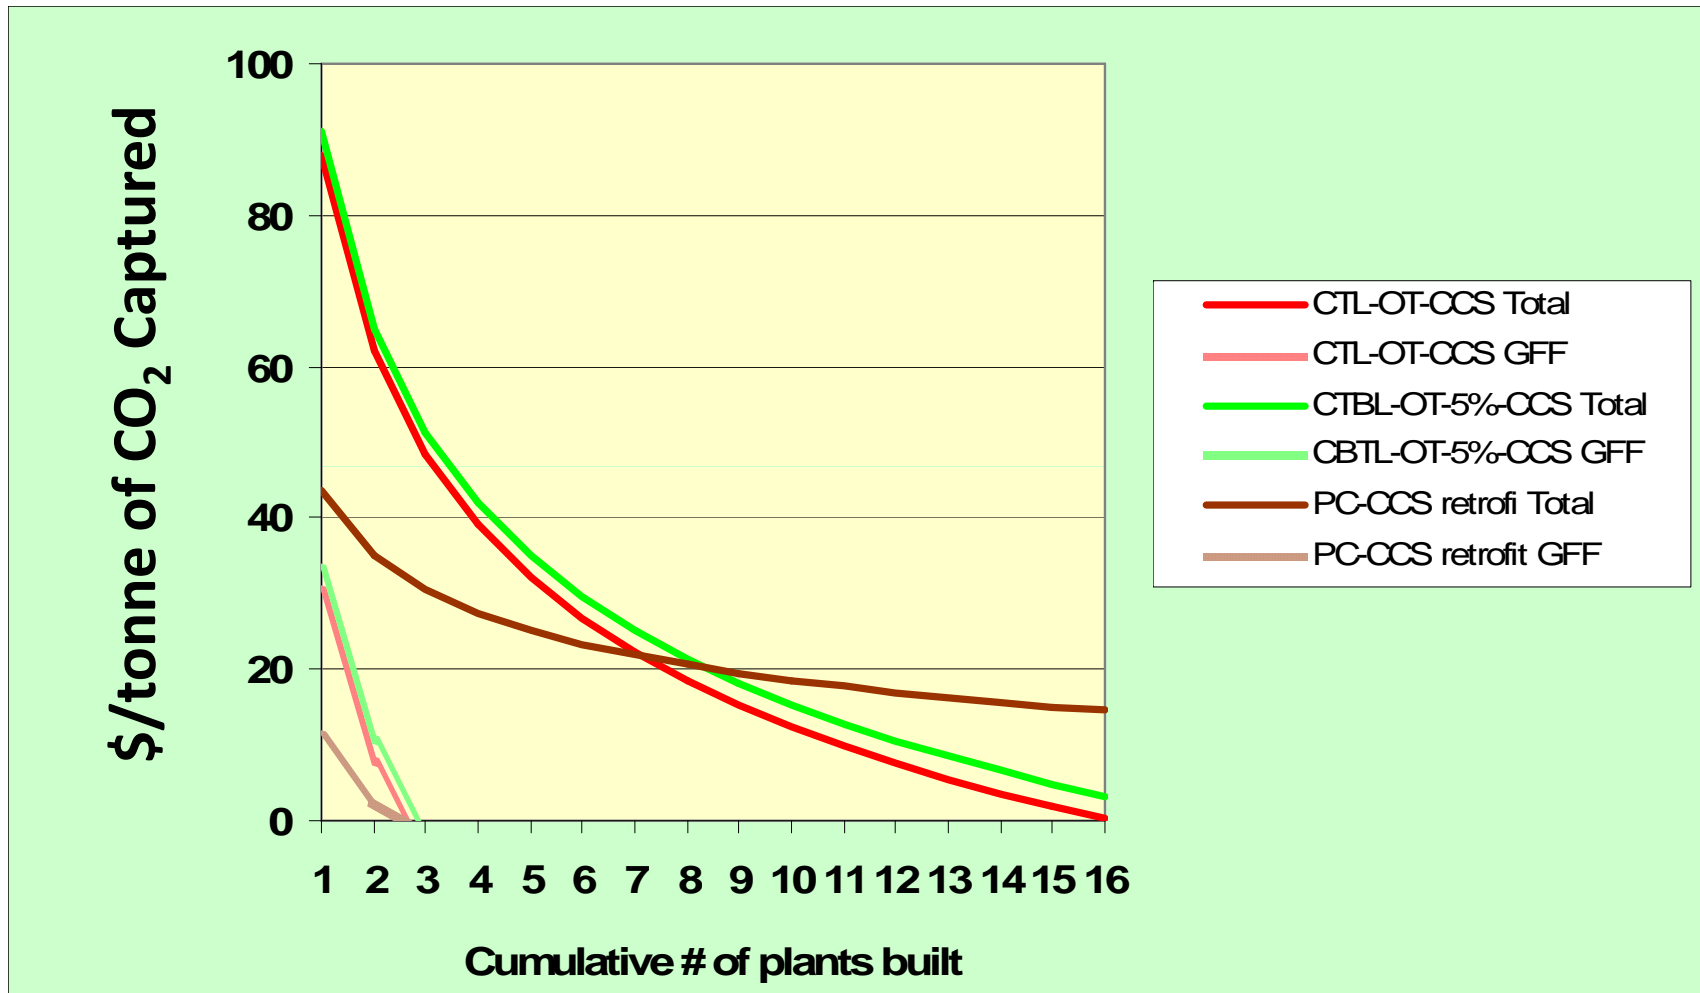

# Total Subsidy and GFF Contribution for Cost Buydown

For all 3 options, no GFF subsidy contribution is needed after 2 plants have been built.

After 16-18 plants have been built, coproduction options require no subsidy.

# Total Subsidy and GFF Contribution for Cost Buydown

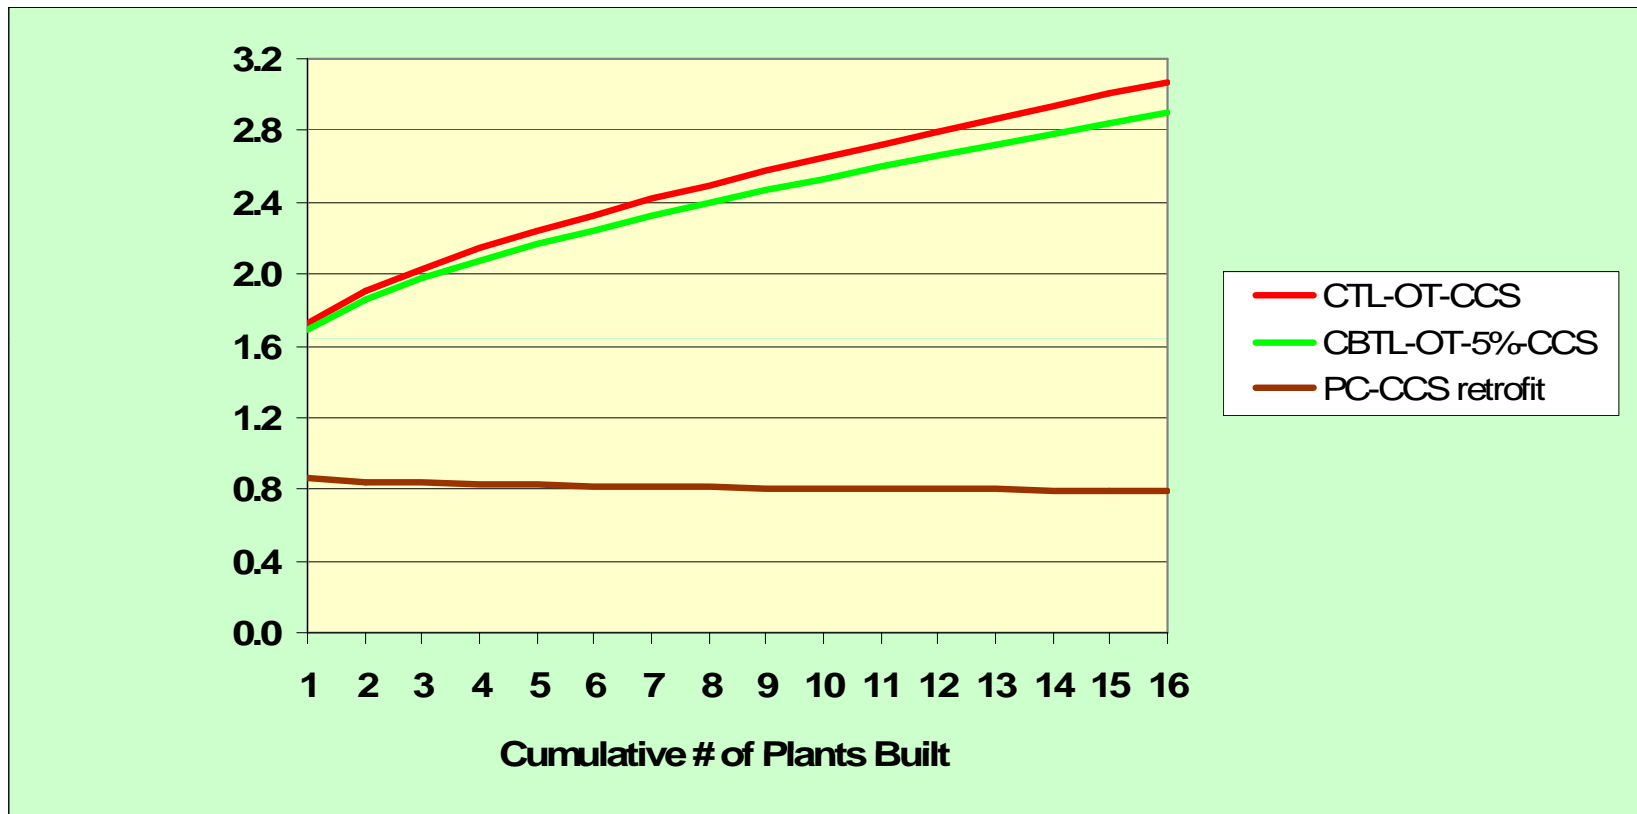

For all 3 options, no GFF subsidy contribution is needed after 2 plants have been built.

After 16-18 plants have been built, coproduction options require no subsidy.

Why do required subsidies decline at different rates?

# Fraction of LCOE Amenable to Learning by Doing (LBD) (dimensionless)

---

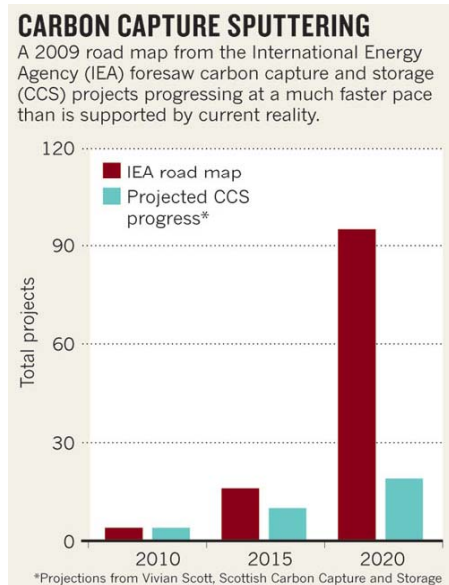

Because the fraction of LCOE amenable to LBD (capital + O&M costs) varies from technology to technology

# Federal Government Perspective on Technology Cost Buydown Strategy

| <b>Buydown Subsidies &amp; Net New Fed. Revenues for 3 Energy Options</b> |                             |   |   |   |
|---|-----------------------------|---|---|---|

# Success with the Proposed Course of Action Would:

- Help get the global CCS enterprise back on track:

Source: Van Noorden (2013)

See also: Scott et al. (2013).

- Undermine the conventional wisdom that has prevented the launching of a coal synfuels industry in the US:

“Addressing climate change and ensuring domestic energy independence have sometimes proved to be contradictory goals, analysts said.”

Source: Broder and Wald (2013)

- Provide a technological platform that would enable the coal industry to thrive in a C-constrained world (Williams, 2013).
